Geometrical Unsupervised Learning of Breast Cancer SubTyping

2024-05-09

Abstract

Molecular subtyping of cancer is recognized as a critical and challenging step towards individua lized therapy. Breast cancer molecular subtyping has revolutionized the treatment and lowered the mortality rate.

In the study, we further analyse breast cancer's subtyping using geometrical unsupervised learning. We aim to find a new way to examine the gene expression data by applying on it a different topology. The topology is applied by using different distance function on the sample space.

In the study we used 5 metrical functions - Pairwise Correlation, Cosine Similarity, Kernel Dist ance, PCA and Euclidean distance for the control analyses.

Pairwise correlation measures the linear relationship between two variables.

Cosine similarity measures the cosine of the angle between two non-zero vectors.

Kernel distance measures nonlinear relationship using a kernel function.

Principal Component Analysis (PCA) is a dimensionality reduction technique, preserving as much variance as possible. After the reduction of the samples to one dimensional variable we measured the distance between the samples using the Euclidean distance.

The research contains RNA sequence samples taken from TCGA dataset. The data contains 313 sample s. The samples are divided by PAM50 classification to 35 "Normal" samples, 68 "Her2" samples and "Luminal A", "Luminal B" and "Basal" samples.

The study pipeline is Desq2 analyses, heatmap and unsupervised hierarchical clustering, survival analyses and pathways enrichments analyses.

Each of the 5 metrics processed through the pipeline. The Euclidean distance, Pairwise Correlati on, Cosine Similarity had similar results. Those results are consistent with the PAM50 common su btyping. The kernel distance did not form clusters. The PCA had different clustering results.

The PCA resulted 3 clusters. Those clusters received the lowest p value in the survival analyse s, yet nonsignificant.

The pathway enrichment analyses didn't contribute difference to any of the clustering of all met rics.

A deeper understanding of the PCA clustering can be done to understand if the results are significant.

Kernel based distance (for nonlinear distance)

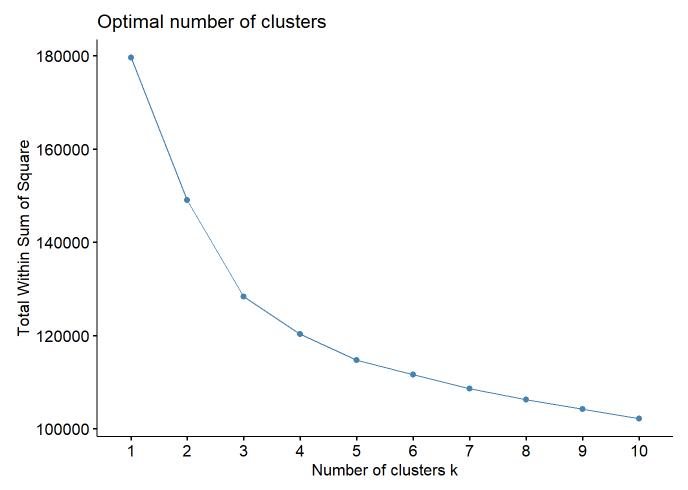

Clustring by Distance functions

In this section we will see the hierarchical clustering plot and add the clustering results for the metadata. Note that for the Kernel distance, function clustering where not created. So further analyses for this distance functions were not calculated

```
# Elbow Graph by Generic Clustering
fviz_nbclust(t(counts.vst.significant), FUN = hcut, method = "wss")
```

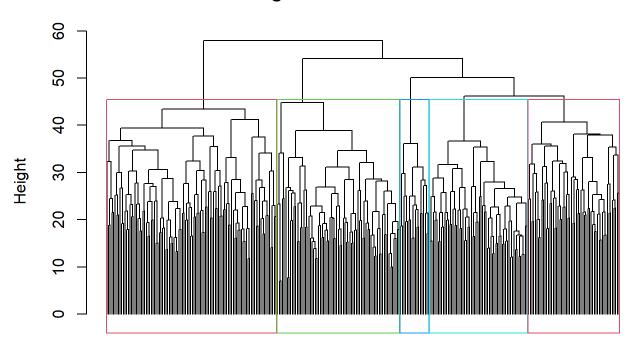

```
k <- 5

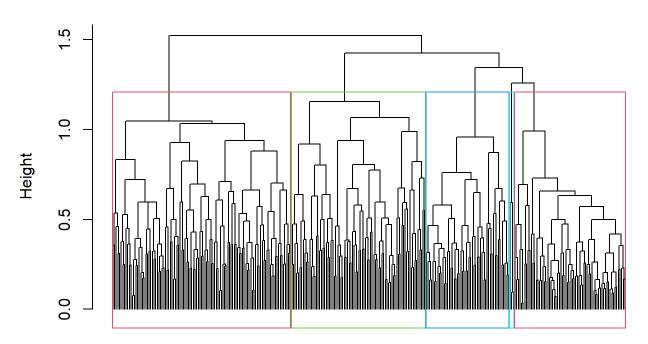

# Clustering By distance functions and add to metadata

# ------ Euclidean Distance
hclust_res_euc <- hclust(dist(t(counts.vst.significant))) # clustering
plot(hclust_res_euc, cex = 0.6, hang = -1, main = "Dendrogram of Euclidean Distance", labels=FAL
SE, xlab="", sub="") # plot
rect.hclust(hclust_res_euc, k = k, border = 2:5)</pre>
```

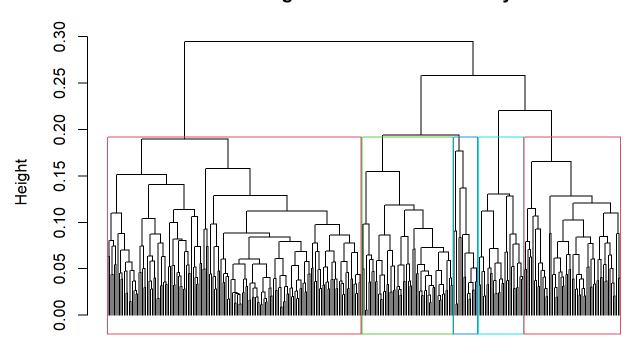

Dendrogram of Euclidean Distance

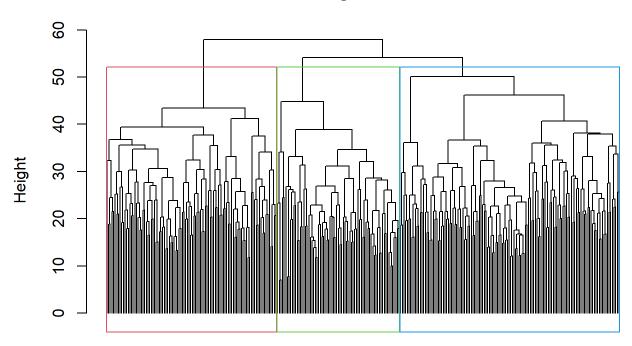

Dendrogram of Pair wise Correlation

Dendrogram of Cosine Similarity

Dendrogram of PCA

```
clusters_pca <- cutree(hclust_res_pca, k =3) # add to metadata
metadata$ClusterPCA <- clusters_pca</pre>
```

Survival Analsys

In this section we will do survival analyses with "Kaplan-Meir" curve.

Enrichment Analysis This section divided to 2 parts. The first part is GSEA on the counts.vst results, where the results are analyses by cluster. In this section no significant pathways for any cluster of the distance functions. Because the similarity between the results, we only presents the euclidean distance and the PCA.

```
